

Infrastructure as a Service

Many organizations want to shed the cost and burden of maintaining their own IT infrastructure. On-premises server, storage and network equipment require power, cooling and security considerations that grow more complex and costly each year.

Segra Infrastructure as a Service (IaaS) removes IT infrastructure complexity from customer-managed server environments, so your team can concentrate on the applications, data, and software stack that drive your mission. Connect over Segra's private fiber network directly into our highly available data centers, staffed 24/7/365, and draw on the compute and storage resources required to run your most critical workloads with confidence.

Segra IaaS is available in two deployment models: a multi-tenant cloud for organizations with modest resource requirements, and a private cloud for organizations that require dedicated resources, greater isolation, and predictable performance. Segra's solution architects will assess your current compute, storage, and software requirements and align them with the Segra cloud solution that best fits your operational and budgetary objectives.

Customer Benefits

Lower capital expense and predictable, ongoing operating costs

Multi-site replication options for added resilience and continuity

A simple, cost-effective path from on-premises hardware to the cloud

Virtualization, hardware, storage, and networking that remain always on and always available

Full control of your environment, with powerful troubleshooting and analytics

Built to scale with your needs, whether you run 1 or 1,000 virtual workloads

Features

- Highly available infrastructure engineered to host mission-critical applications
- Support for a diverse portfolio of enterprise applications
- Reduced capital and operational IT costs
- Simplified operations with less hardware to own, power, and maintain
- Improved application uptime and availability
- Performance and capacity that scale without disruption
